this thesis is about a new model querying and transformation approach called funnyqt which is realized as a set of apis and embedded domain specific languages dsls in the jvm based functional lisp dialect clojure founded on a powerful model management api funnyqt provides querying services such as comprehensions quantified expressions regular path expressions logic based relational model querying and pattern matching on the transformation side it supports the definition of unidirectional model to model transformations of in place transformations it supports defining bidirectional transformations and it supports a new kind of co evolution transformations that allow for evolving a model together with its metamodel simultaneously several properties make funnyqt unique foremost it is just a clojure library thus funnyqt queries and transformations are clojure programs however most higher level services are provided as task oriented embedded dsls which use clojure s powerful macro system to support the user with tailor made language constructs important for the task at hand since queries and transformations are just clojure programs they may use any clojure or java library for their own purpose e g they may use some templating library for defining model to text transformations conversely like every clojure program funnyqt queries and transformations compile to normal jvm byte code and can easily be called from other jvm languages furthermore funnyqt is platform independent and designed with extensibility in mind by default it supports the eclipse modeling framework and jgralab and support for other modeling frameworks can be added with minimal effort and without having to modify the respective framework s classes or funnyqt itself lastly because funnyqt is embedded in a functional language it has a functional emphasis itself every query and every

transformation compiles to a function which can be passed around given to higher order functions or be parametrized with other functions
