this book gives a self contained and up to date account of mathematical results in the linear theory of water waves the study of waves has many applications including the prediction of behavior of floating bodies ships submarines tension leg platforms etc the calculation of wave making resistance in naval architecture and the description of wave patterns over bottom topography in geophysical hydrodynamics the first section deals with time harmonic waves three linear boundary value problems serve as the approximate mathematical models for these types of water waves the next section uses a plethora of mathematical techniques in the investigation of these three problems the techniques used in the book include integral equations based on green s functions various inequalities between the kinetic and potential energy and integral identities which are indispensable for proving the uniqueness theorems the so called inverse procedure is applied to constructing examples of non uniqueness usually referred to as trapped nodes

mathematical techniques for wave interaction with flexible structures is a thoughtful compilation of the various mathematical techniques used to deal with wave structure interaction problems the book emphasizes unique determination of the solution for a class of physical problems associated with laplace or helmholtz type equations satisfying high
