the objective of lubwork was the improvement of cold rolling performance by the use new lubricant concepts and the improved work roll capability oil free and recycled lubricants nanoscaled solids as additives in conventional lubricants and wear reducing coatings have been investigated lubricants based on poly alkylene glycols showed comparable or even better lubrication than conventional lubricants the expected simplified handling properties were given and enable savings through less loss of base oil during continuous care steps the application of recycled oils by conditioning of a second raffinate is possible the performance is acceptable but due to high additivation currently out of economic scope the implementation of nanoscaled solids as additive compound showed positive impact from mos2 particles nevertheless the handling has to be improved as well as environmental impact is not finally clarified pvd coatings of tihfcrn have shown good resistance against wear on different substrates massively increased wear on products side was not finally clarified therefore further examination is necessary technical scale trials with pag based lubricants have shown good results for steel either hot aluminium an economic application is possible long term effects of lubricants behaviour and impact on subsequent processes has to be examined in detail

this project aimed at improving cooling performances in cold rolling to make better lubricant properties in order to limit interaction between cooling and mill vibrations and to optimise selective cooling for flatness control tests of new cooling techniques combination of different types or arrangements of nozzles high turbulence cooling techniques have been derived in design procedures and practical recommendations to improve cold mills productivity product quality and water usage when a lower exit strip temperature and or a decrease of sensitivity to mill vibrations are required without designing completely new headers on an existing mill a solution consists in optimising interstand strip cooling through the use of two coolant temperature circuits one hot and one cold in combination with drying ramps in last mill interstands to limit perturbation of lubrication by cooling when a decrease of water usage is required while maintaining a good cooling capacity it is recommended to design new headers to use full cone nozzles for interstands strip cooling and new headers for the use of small roll cooling nozzles the benefit in terms of flow rates so water usage may be more than 30 water usage decrease in comparison to mills with normal to high flow rates the high turbulence roll cooling solution alternative to nozzles based cooling techniques is a promising technique that should avoid perturbation of the lubrication system by cooling while working at a very low pressure saving of energy a new algorithm of selective cooling for exit strip flatness has been developed that determines automatically the required number of nozzles opened to maintain a good flatness this new control strategy contributes to having an optimum efficiency of selective

cooling whatever rolling conditions different types of models have been developed and further used to design the above new cooling configurations and to deeply understand what makes a cooling configuration or technique efficient the expected benefits for the european steel industry are the possibility to achieve higher rolling speeds and reductions to decrease oil consumption and oil cost and to reduce water consumption and recycled coolant quantities positive environmental aspect
