chiral algebras form the primary algebraic structure of modern conformal field theory
each chiral algebra lives on an algebraic curve and in the special case where this curve
is the affine line chiral algebras invariant under translations are the same as well known
and widely used vertex algebras the exposition of this book covers the following topics
the classical counterpart of the theory which is an algebraic theory of non linear
differential equations and their symmetries the local aspects of the theory of chiral
algebras including the study of some basic examples such as the chiral algebras of
differential operators the formalism of chiral homology treating the space of conformal
blocks of the conformal field theory which is a quantum counterpart of the space of the
global solutions of a differential equation the book will be of interest to researchers
working in algebraic geometry and its applications to mathematical physics and
representation theory

this book presents for the first time a systematic formulation of the geometric theory of
noncommutative pde s which is suitable enough to be used for a mathematical
description of quantum dynamics and quantum field theory a geometric theory of
supersymmetric quantum pde s is also considered in order to describe quantum
supergravity covariant and canonical quantizations of super pde s are shown to be
founded on the geometric theory of pde s and to produce quantum super pde s by
means of functors from the category of commutative super pde s to the category of
quantum super pde s global properties of solutions to super commutative pde s are
obtained by means of their integral bordism groups
