this monograph offers a fresh perspective on the applicability of mathematics in science it explores what  
mathematics must be so that its applications to the empirical world do not constitute a mystery in the process  
readers are presented with a new version of mathematical structuralism the author details a philosophy of  
mathematics in which the problem of its applicability particularly in physics in all its forms can be explained and  
justified chapters cover mathematics as a formal science mathematical ontology what does it mean to exist  
mathematical structures what are they and how do we know them how different layers of mathematical  
structuring relate to each other and to perceptual structures and how to use mathematics to find out how the  
world is the book simultaneously develops along two lines both inspired and enlightened by edmund husserl s  
phenomenological philosophy one line leads to the establishment of a particular version of mathematical  
structuralism free of naturalist and empiricist bias the other leads to a logical epistemological explanation and  
justification of the applicability of mathematics carried out within a unique structuralist perspective this second  
line points to the unreasonable effectiveness of mathematics in physics as a means of representation a tool and a  
source of not always logically justified but useful and effective heuristic strategies
