rivers are an excellent witness of the dynamics affecting earth's surface due to their sedimentary products and morphological expression which may be considered as fluvial archives until now the focus has been on evaluating the general impact of individual external factors however the importance of the specific environmental characteristics of these factors has become increasingly recognized as highlighted in recent case studies for example the effects of regional climate differentiated topography and vegetation and frozen ground appear to play an essential role in the evolution of the fluvial system integration of such environmental conditions in the processes that were active within the complex fluvial system will open new perspectives in our progressive understanding of the evolution of landscape form ecology sediment fluxes and hydrology of the system within the framework of the external drivers such as tectonics general climate and human activity this is an appealing challenge that we wish to address in the present special issue under the aegis of the fluvial archives group flag

alluvial and fluvial fans are the most widespread depositional landform bordering the margins of highland regions and actively subsiding continental basins across a broad spectrum of tectonic and climatic settings they are significant to the local morphodynamics of mountain regions and also to the evolution of sediment routing systems affecting the propagation and preservation of stratigraphic signals of environmental change over vast areas the volume presents case studies discussing the geology and geomorphology of alluvial and fluvial fans from both active systems and ancient ones preserved in the stratigraphic record it brings together case studies from a range of continents climatic and tectonic settings some introducing innovative monitoring and analysis techniques and it provides an overview of current debates in the field this volume will be of particular interest to geologists geomorphologists sedimentologists and the general reader with an interest in earth science

the sinuous form and peculiar evolution of meandering rivers has long captured the imagination of people today meandering rivers exist in some of the most densely populated areas in the world where they provide environmental and economic wealth and opportunities as well as posing hazards through geological time the ancestors of these modern meanders built deposits that are now host to mineral resources groundwater and hydrocarbons this special publication illustrates the breadth of current research on meandering rivers and their deposits the collection of research papers demonstrates the state of science on fluvial process product relationships the articles cover fundamental and applied studies of both modern and ancient rivers are based on state of the art technology include complementary philosophical approaches and span a wide range of spatial and temporal scales this book includes some of the most recent advances in the study of the morphodynamics and sedimentology of meandering rivers and is an important resource for those who want to investigate fluvial systems and their deposits

this volume provides a comprehensive perspective on geomorphic approaches to management of lowland alluvial rivers in north america and europe many lowland rivers have been heavily managed for flood control and navigation for decades or centuries resulting in engineered channels and embanked floodplains with substantially altered sediment loads and geomorphic processes over the past decade floodplain management of many lowland rivers has taken on new importance because of concerns about the potential for global environmental change to alter floodplain processes necessitating revised management strategies that minimize flood risk while enhancing environmental attributes of floodplains influenced by local embankments and upstream dams recognition of the failure of old perspectives on river management and the need to enhance environmental sustainability has stimulated a new approach to river management the manner that river restoration and integrated management are implemented however requires a case study approach that takes into account the impact of historic human impacts to the system especially engineering the river basins examined in this volume provide a representative coverage of the drainage of north america and europe taking into account a range of climatic and physiographic provinces they include the 1 sacramento california usa 2 san joaquin california 3 missouri missouri usa 4 red manitoba canada and minnesota usa 5 mississippi louisiana usa 6 kissimmee florida usa 7 ebro spain 8 rhone france 9 rhine netherlands 10 danube romania and 11 volga russian federation rivers the case studies covered in these chapters span a range of fluvial modes of adjustment including sediment channel hydrologic regime floodplains as well as ecosystem and environmental associations
