the deep and original ideas of norman levinson have had a lasting impact on fields as diverse as differential integral equations harmonic complex stochas tic analysis and analytic number theory during more than half a century yet the extent of his contributions has not always been fully recognized in the mathematics community for example the horseshoe mapping constructed by stephen smale in 1960 played a central role in the development of the modern theory of dynami cal systems and chaos the horseshoe map was directly stimulated by levinson s research on forced periodic oscillations of the van der pol oscillator and specifi cally by his seminal work initiated by cartwright and littlewood in other topics levinson provided the foundation for a rigorous theory of singularly perturbed dif ferential equations he also made fundamental contributions to inverse scattering theory by showing the connection between scattering data and spectral data thus relating the famous gel fand levitan method to the inverse scattering problem for the schrodinger equation he was the first to analyze and make explicit use of wave functions now widely known as the jost functions near the end of his life levinson returned to research in analytic number theory and made profound progress on the resolution of the riemann hypothesis levinson s papers are typically tightly crafted and masterpieces of brevity and clarity it is our hope that the publication of these selected papers will bring his mathematical ideas to the attention of the larger mathematical community

norman levinson 1912 1975 was a mathematician of international repute this collection of his selected papers bears witness to the profound influence levinson had on research in mathematical analysis with applications to problems in science and technology
