--- Sample Neurosurgery Practice Questions and Answers

Below are sample questions across various categories, complete with detailed answers to facilitate learning.

Neuroanatomy and Neurophysiology

Question 1: Which artery is most commonly involved in a classic lateral medullary (Wallenberg) syndrome?

Answer: The posterior inferior

cerebellar artery (PICA) is most commonly involved in Wallenberg syndrome. Explanation: Wallenberg syndrome results from ischemia in the lateral medulla, often due to occlusion of the PICA. This leads to symptoms such as vertigo, ipsilateral facial numbness, and contralateral limb numbness. - - Question 2: Which cranial nerves are primarily affected in an oculomotor nerve (cranial nerve III) palsy? Answer: Cranial nerve III (oculomotor nerve) controls muscles responsible for most eye movements, eyelid elevation, and pupil constriction. Affected functions include: - Eye movement (up, down, inward) - Eyelid elevation (via levator palpebrae superioris) - Pupil constriction (via parasympathetic fibers) Common clinical features: - Ptosis (drooping eyelid) - "Down and out" eye position due to unopposed lateral rectus and superior oblique - Dilated pupil with poor constriction --- Neurosurgical Procedures and Techniques Question 3: What are the key considerations when performing a craniotomy for a supratentorial tumor? Answer: Key considerations include: - Preoperative imaging: MRI/CT to determine tumor location, size, and relation to critical structures. - Patient positioning: 3 Optimal to provide access and reduce intracranial pressure. - Surgical approach: Choosing the least invasive route with maximal exposure. - Hemostasis: Managing bleeding risks, especially near major vessels. - Neurophysiological monitoring: Utilizing intraoperative neuro-monitoring for cranial nerves and motor pathways. - Postoperative care: Monitoring for edema, hemorrhage, and neurological deficits. --- Question 4: Describe the steps involved in performing a posterior fossa craniotomy. Answer: Steps include: 1. Patient positioning: Prone or sitting position, with head fixation. 2. Skin incision: Typically a midline or paramedian incision over occipital bone. 3. Bone removal: Craniotomy of the occipital bone, sometimes extending into the foramen magnum. 4. Dural opening: Carefully incising the dura to expose the cerebellum and brainstem. 5. Lesion access and resection: Using microsurgical techniques to remove tumors or address hemorrhage. 6. Hemostasis and closure: Ensuring bleeding control, closing dura, replacing bone flap if applicable, and suturing soft tissue. --- Neuro-oncology Question 5: What are the typical MRI features of a meningioma? Answer: Features include: - Extra-axial mass with broad-based dural attachment - Homogeneous enhancement after contrast administration - Dural tail sign (thickening and enhancement of dura adjacent to the tumor) - Well-circumscribed and lobulated shape - Possible calcifications and hyperostosis of adjacent bone --- Question 6: What is the primary goal in the surgical management of glioblastoma multiforme (GBM)? Answer: The primary goal is maximal safe resection of the tumor to reduce mass effect and improve prognosis, followed by adjuvant therapies such as radiotherapy and chemotherapy. Note: Complete resection is challenging due to infiltrative nature; thus, preserving neurological function is paramount. --- Trauma and Critical Care Question 7: What are the signs of increased intracranial pressure (ICP)? Answer: Signs include: - Headache worse in the morning - Nausea and vomiting - Papilledema (optic disc swelling) - Altered mental status or decreased

consciousness - Cushing's triad: hypertension, bradycardia, irregular respirations - Pupillary changes (dilated or sluggish response) --- Question 8: Describe the management of an acute epidural hematoma. Answer: Management steps involve: 1. Immediate assessment: Airway, breathing, circulation (ABCs). 2. Neurosurgical consultation: Urgent imaging (CT scan) showing biconvex hematoma. 3. Surgical intervention: Emergency craniotomy to evacuate hematoma and control bleeding. 4. Postoperative care: Monitoring ICP, preventing secondary brain injury, and supportive care. --- 4 Vascular Neurosurgery Question 9: What are the common surgical options for treating a ruptured cerebral aneurysm? Answer: Options include: - Clipping: Placing a clip across the neck of the aneurysm to prevent rebleeding. - Endovascular coiling: Filling the aneurysm sac with coils via catheter to induce thrombosis. - Flow diversion devices: Using stent-like devices to divert blood flow away from the aneurysm (more common in unruptured aneurysms). Decision factors: - Aneurysm size and location - Patient's clinical status - Anatomy suitability for endovascular vs. surgical clipping --- Tips for Effective Preparation Using Practice Questions - Regular practice: Schedule consistent sessions with diverse questions. - Review explanations: Understand why an answer is correct or incorrect. - Utilize multiple resources: Textbooks, online question banks, and peer discussions. - Simulate exam conditions: Practice timed questions to improve test-taking skills. - Identify weak areas: Focus subsequent study on topics where mistakes are frequent. --- Conclusion Mastering neurosurgery practice questions and answers is a vital step toward becoming a competent neurosurgeon or passing relevant exams. The breadth and depth of neurosurgical knowledge demand continuous learning and self-assessment. By systematically engaging with practice questions across different topics, learners can build confidence, refine their clinical reasoning, and stay updated with evolving surgical techniques and management strategies. Remember, consistent practice paired with comprehensive understanding ultimately leads to improved patient outcomes and professional success in neurosurgery. --- Disclaimer: The questions and answers provided are for educational purposes and should not replace clinical judgment or expert consultation in real-world practice.

QuestionAnswer What are the most common diagnostic imaging techniques used in neurosurgery practice? The most common imaging modalities include magnetic resonance imaging (MRI), computed tomography (CT) scans, and angiography. MRI provides detailed soft tissue visualization, essential for diagnosing brain and spinal cord pathologies, while CT scans are quick and effective for detecting hemorrhages and bone abnormalities. Angiography is used to evaluate vascular lesions. 5 How should a neurosurgeon approach the management of a patient with a traumatic brain injury? Management involves rapid assessment and stabilization following the ABCs (Airway, Breathing, Circulation), neuroimaging to assess injury extent, and surgical intervention if necessary (e.g., hematoma evacuation). Monitoring intracranial pressure,

controlling intracranial hypertension, and supportive care are critical to optimize outcomes. What are key considerations in the surgical treatment of spinal tumors? Key considerations include accurate tumor localization, preserving neurological function, achieving maximal safe resection, and minimizing spinal instability. Preoperative imaging guides surgical planning, and intraoperative neurophysiological monitoring helps prevent nerve injury. Postoperative radiotherapy may be necessary for certain tumor types. What are the indications for elective craniotomy in neurosurgical practice? Elective craniotomy is indicated for conditions such as brain tumors, aneurysms, arteriovenous malformations, and certain benign lesions like meningiomas. Proper patient selection, detailed imaging, and multidisciplinary planning are essential to optimize surgical outcomes. How can neurosurgeons minimize postoperative complications like infections and cerebrospinal fluid leaks? Preoperative measures include strict aseptic technique and prophylactic antibiotics. Intraoperatively, meticulous dural closure, tissue handling, and hemostasis are vital. Postoperative care involves close monitoring for signs of infection or CSF leaks, early intervention if complications arise, and patient education for wound care.
