the creation of the text really began in 1976 with the author being involved with a group of researchers at stanford university and the naval ocean systems center san diego at that time adaptive techniques were more laboratory and mental curiosities than the accepted and pervasive categories of signal processing that they have become over the lasl 10 years adaptive filters have become standard components in telephony data communications and signal detection and tracking systems their use and consumer acceptance will undoubtedly only increase in the future the mathematical principles underlying adaptive signal processing were initially fascinating and were my first experience in seeing applied mathematics work for a paycheck since that time the application of even more advanced mathematical techniques have kept the area of adaptive signal processing as exciting as those initial days the text seeks to be a bridge between the open literature in the professional journals which is usually quite concentrated concise and advanced and the graduate classroom and research environment where underlying principles are often more important

this book brings together mathematics education research that makes a difference in both theory and practice research that anticipates problems and needed knowledge before they become impediments to progress

nowadays tensors play a central role for the representation mining analysis and fusion of multidimensional multimodal and heterogeneous big data in numerous fields this set on matrices and tensors in signal processing aims at giving a self contained and comprehensive presentation of various concepts and methods starting from fundamental algebraic structures to advanced tensor based applications including recently developed tensor models and efficient algorithms for dimensionality reduction and parameter estimation although its title suggests an orientation towards signal processing the results presented in this set will also be of use to readers interested in other disciplines this first book provides an introduction to matrices and tensors of higher order based on the structures of vector space and

tensor space some standard algebraic structures are first described with a focus on the hilbertian approach for signal representation and function approximation based on fourier series and orthogonal polynomial series matrices and hypermatrices associated with linear bilinear and multilinear maps are more particularly studied some basic results are presented for block matrices the notions of decomposition rank eigenvalue singular value and unfolding of a tensor are introduced by emphasizing similarities and differences between matrices and tensors of higher order

this volume takes a new look at one of the greatest works of hellenistic mathematics apollonius of perga s conica it provides a long overdue alternative to h g zeuthen s die lehre von den kegelschnitten im altertum the central part of the volume contains a historically sensitive analysis and interpretation of the entire conica both from the standpoint of its individual books and of the text as a whole particular attention is given to books v vii which have had scant treatment until now two chapters in the volume concern histioriographic issues connected with the conica in paricular and greek mathematics in general although the volume is intended primarily for historians of ancient mathematics its approach is fresh and engaging enough to be of interest also to historians philosophers linguists and open minded mathematicians
