specialist periodical reports provide systematic and detailed review coverage of progress in the major areas of chemical research written by experts in their specialist fields the series creates a unique service for the active research chemist supplying regular critical in depth accounts of progress in particular areas of chemistry for over 80 years the royal society of chemistry and its predecessor the chemical society have been publishing reports charting developments in chemistry which originally took the

form of annual reports however by 1967 the whole spectrum of chemistry could no longer be contained within one volume and the series specialist periodical reports was born the annual reports themselves still existed but were divided into two and subsequently three volumes covering inorganic organic and physical chemistry for more general coverage of the highlights in chemistry they remain a must since that time the spr series has altered according to the fluctuating degree of activity in various fields of chemistry some titles have remained unchanged while others have altered their emphasis along with their titles some have been combined under a new name whereas others have had to be discontinued

while a satisfactory description of liquid vapour equilibria in binary and multi component systems had been developed by the end of the fifties a similar situation has only been attained for liquid liquid equilibria in the last ten years there are several reasons for this the most important of which is the necessity to employ more complex thermodynamic models for a quantitative description of liquid liquid equilibria these models require very sophisticated calculation techniques that cannot be carried out without the assistance of a computer the authors have attempted to provide a theoretical description of liquid liquid equilibria at a level permitting routine chemical engineering applications similar to those common for liquid vapour equilibria consequently a great deal of attention is paid to the calculation of parameters for heterogeneous and homogeneous binary systems and to the qualitative evaluation of the suitability of the most frequently used thermodynamic models
