this book is based on a set of lectures given to a mixed audience of physicists and mathematicians the desire to be intelligible to both groups is the underlying preoccupation of the author physicists nowadays are particularly interested in phase transitions the typical

situation is that a system of interacting particles exhibits an abrupt change of behaviour at a certain temperature although the local forces between the particles are thought to be smooth functions of temperature this account discusses the theory behind a simple model of such phenomena an important tool is the mathematical discipline known as the theory of graphs there are five chapters each subdivided into sections the first chapter is intended as a broad introduction to the subject and it is written in a more informal manner than the rest notes and references for each chapter are given at the end of the chapter

some of the results on automatic continuity of intertwining operators and homomorphisms that were obtained between 1960 and 1973 are here collected together to provide a detailed discussion of the subject the book will be appreciated by graduate students of functional analysis who already have a good foundation in this and in the theory of banach algebras

these lecture notes begin with an introduction to topological groups and proceed to a proof of the important pontryagin van kampen duality theorem and a detailed exposition of the structure of locally compact abelian groups measure theory and banach algebra are entirely avoided and only a small amount of group theory and topology is required dealing with the subject in an elementary fashion with about a hundred exercises for the student it is a suitable text for first year graduate courses

these expository lectures contain an advanced technical account of a branch of mathematical analysis in his own lucid and readable style the author begins with a comprehensive review of the methods of bounded operators in a hilbert space he then goes on to discuss a wide variety of applications including fredholm theory and more specifically his own specialty of mathematical quantum theory included also are an extensive and up to date list of references enabling the reader to delve more deeply into this topical subject

these notes based on lectures given at the university of newcastle upon tyne provide an introduction to the theory of von neumann algebras

these notes describe methods of constructing skew fields in particular the coproduct coconstruction discovered by the author and trace out some of the consequences using the powerful coproduct theorems of g m bergman which are proved here publisher

these lecture notes are devoted to an area of current research interest that bridges functional analysis and function theory the unifying theme is the notion of subharmonicity with respect to a uniform algebra the topics covered include the rudiments of choquet theory

various classes of representing measures the duality between abstract sub harmonic functions and jensen measures applications to problems of approximation of plurisubharmonic functions of several complex variables and cole s theory of estimates for conjugate functions many of the results are published here for the first time in monograph form

the theory of transformation groups studies symmetries of various mathematical objects such as topological spaces manifolds polyhedra and function spaces it is thus a central concept in many branches of mathematics this volume contains 25 of the papers submitted at the conference on transformation groups held at the university of newcastle upon tyne in august 1976
