this book is mainly intended for first year university students who undertake a basic abstract algebra course as well as instructors it contains the basic notions of abstract algebra through solved exercises as well as a true or false section in each chapter each chapter also contains an essential background section which makes the book easier to use

this book the second of two volumes contains approximately 350 exercises in algebra which have featured exam questions for the algebraic structure and algebra i courses taught by the authors at the university of pisa each exercise is presented together with one or more solutions carefully written with consistent language and notation a distinguishing feature of this book is the fact that each exercise is unique and requires some creative thinking to be solved the themes covered in this volume are group theory and sylow theorems commutative rings with an emphasis on unique factorisation gaussian integers field extensions and galois theory the book includes a detailed section recalling relevant theory that can be used as a reference for study and revision a list of preliminary exercises introduces the main techniques to be applied in solving the proposed exam questions this volume is aimed at second year students in mathematics and computer science

this book includes studies that give mathematical solution methods and mathematical modeling to support these methods for solving problems in the current application area of engineering as well as studies that include solutions for problems that are also related to current life areas in this book some current problems in the field of mathematics and engineering solutions to solve these problems and existing engineering methods for these problems are included basically machinery chemistry electronics computers construction environment etc studies in both the application and theoretical fields of mathematics are needed to solve optimization modeling encryption methods and thermal problems that are currently encountered in engineering fields in this book some current problems are presented and related theoretical and applied mathematical studies are included

the book is intended to serve as an introductory course in group theory geared towards second year university students it aims to provide them with the background needed to pursue more advanced courses in algebra and to provide a rich source of examples and exercises studying group theory began in the late eighteenth century and is still gaining importance due to its applications in physics chemistry geometry and many fields in mathematics the text is broadly divided into three parts the first part establishes the prerequisite knowledge required to study group theory this includes topics in set theory

geometry and number theory each of the chapters ends with solved and unsolved exercises relating to the topic by doing this the authors hope to fill the gaps between all the branches in mathematics that are linked to group theory the second part is the core of the book which discusses topics on semigroups groups symmetric groups subgroups homomorphisms isomorphism and abelian groups the last part of the book introduces sage a mathematical software that is used to solve group theory problems here most of the important commands in sage are explained and many examples and exercises are provided

many problems in operator theory lead to the consideration of operator equations either directly or via some reformulation more often than not however the underlying space is too small to contain solutions of these equations and thus it has to be enlarged in some way the berberian quigley enlargement of a banach space which allows one to convert approximate into genuine eigenvectors serves as a classical example in the theory of operator algebras a C^* algebra A that turns out to be small in this sense traditionally is enlarged to its universal enveloping von neumann algebra A'' this works well since von neumann algebras are in many respects richer and from the banach space point of view A is nothing other than the second dual space of A among the numerous fruitful applications of this principle is the well known kadison sakai theorem ensuring that every derivation δ on a C^* algebra A becomes inner in A'' though δ may not be inner in A the transition from A to A'' however is not an algebraic one and cannot be since it is well known that the property of being a von neumann algebra cannot be described purely algebraically hence if the C^* algebra A is small in an algebraic sense say simple it may be inappropriate to move on to A'' in such a situation A is typically enlarged by its multiplier algebra $M(A)$

back by popular demand the maa is pleased to reissue this outstanding collection of problems and solutions from the putnam competitions covering the years 1938 1964 problemists the world over including all past and future putnam competitors will revel in mastering the difficulties posed by this collection of problems from the first 25 william lowell putnam competitions solutions to all 347 problems are given in some cases multiple solutions are included

some which contestants could reasonably be expected to find under examination conditions and others which are more elegant or utilize more sophisticated techniques valuable references and historical comments on many of the problems are presented the book concludes with four articles on the putnam competition written by g birkhoff l e bush l j mordell and l m kelly which are reprinted from the american mathematical monthly there is great appeal here for all teachers students and all those who love good problems and see them as an entree to beautiful and powerful ideas back cover
