radiations or evolution in action we have just celebrated the darwin year with the double anniversary of his 200th birthday and 150th year

of his masterpiece on the origin of species by means of natural selection in this work darwin established the factual evidence of biological evolution that species change over time and that new organisms arise by the splitting of ancestral forms into two or more descendant species however above all darwin provided the mechanisms by arguing convincingly that it is by natural selection as well as by sexual selection as he later added that organisms adapt to their environment the many discoveries since then have essentially confirmed and strengthened darwin s central theses with latest evidence for example from molecular genetics revealing the evolutionary relationships of all life forms through one shared history of descent from a common ancestor we have also come a long way to progressively understand more on how new species actually originate i e on speciation which remained darwin s mystery of mysteries as noted in one of his earliest transmutation notebooks since speciation is the underlying mechanism for radiations it is the ultimate causation for the biological diversity of life that surrounds us
