how did humans evolve larger and more sophisticated brains in general evolution depends on a special combination of circumstances part genetics part time and part environment in the case of human brain evolution the main environmental influence was adaptation to a shore based diet which provided the world's richest source of nutrition as well as a sedentary lifestyle that promoted fat deposition such a diet included shellfish fish marsh plants frogs bird's eggs etc humans and more importantly hominid babies started to get fat a crucial distinction that led to the development of larger brains and to the evolution of modern humans a larger brain is expensive to maintain and this increasing demand for energy results in survival of the fittest

the evolution of the human brain and cognitive ability is one of the central themes of physical biological anthropology this book discusses the emergence of human cognition at a conceptual level describing it as a process of long adaptive stasis interrupted by short periods of cognitive advance these advances were not linear and directed but were acquired indirectly as part of changing human behaviors in other words through the process of exaptation acquisition of a function for which it was not originally selected based on studies of the modern human brain certain prerequisites were needed for the development of the early brain and associated cognitive advances this book documents the energy and nutrient constraints of the modern brain highlighting the significant role of long chain polyunsaturated fatty acids lcpufa in brain development and maintenance crawford provides further emphasis for the role of essential fatty acids in particular dha in brain development by discussing the evolution of the eye and neural systems this is an ideal book for graduate students post docs research scientists in physical biological anthropology human biology archaeology nutrition cognitive science neurosciences it is also an excellent selection for a grad student discussion seminar

by focusing on the cellular mechanisms that underlie ontogeny phylogeny and regeneration of complex physiologic traits evolution

the logic of biology demonstrates the use of homeostasis the fundamental principle of physiology and medicine as the unifying mechanism for evolution as all of biology the homeostasis principle can be used to understand how environmental stressors have affected physiologic mechanisms to generate condition specific novelty through cellular mechanisms evolution the logic of biology allows the reader to understand the vertebrate life cycle as an intergenerational continuum in support of effective on going environmental adaptation by understanding the principles of physiology from their fundamental unicellular origins culminating in modern day metazoans the reader as student researcher or practitioner will be encouraged to think in terms of the prevention of disease rather than in the treatment of disease as the eradication of symptoms by tracing the ontogeny and phylogeny of this and other phenotypic homologies one can perceive and understand how complex physiologic traits have mechanistically evolved from their simpler ancestral and developmental origins as cellular structures and functions providing a logic of biology for the first time evolution the logic of biology will be an invaluable resource for graduate students and researchers studying evolutionary development medicine and biology anthropology comparative and developmental biology genetics and genomics and physiology

an integrative view of the evolution of genetics and the natural world even in this advanced age of genomics the evolutionary process of unicellular and multicellular organisms is continually in debate evolutionary biology cell cell communication and complex disease challenges current wisdom by using physiology to present an integrative view of the nature origins and evolution of fundamental biological systems providing a deeper understanding of the way genes relate to the traits of living organisms this book offers useful information applying evolutionary biology functional genomics and cell communication studies to complex disease examining the 4 5 billion year evolution process from environment adaptations to cell cell communication to communication of genetic information for reproduction evolutionary biology hones in on the why and how of evolution by uniquely focusing on the cell as the smallest unit of biologic structure and function based on empirically derived data rather than association studies evolutionary biology covers a model for forming testable hypotheses in complex disease studies the integrating role played by the evolution of metabolism especially lipid metabolism the evolutionary continuum from development to homeostasis regeneration and aging mediated by signaling molecules ambitious and game changing evolutionary biology suggests that biology began as a mechanism for reducing energy within the cell defying the second law of thermodynamics an ideal text for those interested in forward thinking scientific study the insights presented in evolutionary biology help practitioners effectively comprehend the evolutionary process
