struggling to reassert control over their indochinese colonies after world war ii the french established a huge air land base in the valley of dien bien phu but when the opposing vietnamese people s army vpa began massing its forces against the base in late 1953 french commanders seized the opportunity to draw their elusive enemy into a decisive set piece battle defending a series of fortified positions which were reliant upon a single airstrip and later risky and inaccurate airdrops for reinforcement and resupply the french troops quickly discovered that they had underestimated their enemy in 56 days of costly close quarters fighting the vpa slowly dislodged the french from one strongpoint after another by developing novel tactics and accomplishing incredible feats of engineering drawing upon vietnamese language sources never previously employed in western accounts of the siege valley of the shadow is a dramatic re telling of the climactic battle of the first indochina war the conflict that saw the french expelled from their former colony and set the stage for the american war in vietnam

in recent years the ohio department of transportation odot has reconstructed a number of roadways where asphalt pavements were replaced with random transverse grooved concrete pavements upon completion residents living adjacent to the reconstructed roadways have complained of increased noise levels the federal highway administration fhwa traffic noise model tnm is used to determine if predicted traffic noise levels warrant abatement and to design the abatement structures the public perception problem described above suggests that the model does not result in adequate noise barrier abatement designs near random transverse grooved concrete pavements the overall goal of this project was to provide odot with accurate tnm noise predictions when modeling random transverse grooved concrete pavement highways three random transverse grooved pcc roadway sites were chosen for study where high quality sound recordings were taken sites 1 cincinnati i 275 and 2 troy i 75 were chosen to represent the noise quality experienced by residents adjacent to the roadway where the residential areas were separated from the roadway by sound barriers site 3 madison county i 70 was chosen to study the attenuation of road noise with distance in an easily characterized environment an open soybean cropland essentially level on both sides of the roadway with no noise barrier through a paired t test the research findings determined that the sample means of the tnm average pavement and the odot random transverse grooved pavement were not equivalent based upon a level of confidence of 95 percent an examination of the one third octave band frequency levels indicated that at frequencies greater than 500 hz the measured traffic noise levels exceeded both the tnm average pavement type and tnm odot random transverse grooved pavement predictions however at frequencies less than 500 hz the predictions tended to exceed the measurements it is recommended that the

experimental version of tnm developed for this project using the current odot random transverse grooved concrete pavement remel should not be used in practice due to its potential to under predict traffic noise levels a new surface texture specification should also be developed for concrete pavements to replace the current specification in order to reduce tire pavement noise levels while maintaining or improving safety and durability characteristics
