the current technological challenges mean that engineers are expected to apply the available extraction in the field of extractive metallurgy extraction of copper one of the most used metals has been practiced since ancient times around the world three crucial steps namely sulphide roasting leaching of ores and concentrates and electro extraction through solvent extraction are described here with ample details diagrams examples and explanations to enlighten practitioners these techniques are widespread where copper ores are mined these modes of extraction are applied in operations for many non ferrous metals from where the interest of this book which enters in the collection of extractive metallurgy roger rumbu met eng ppm tbom

this historic book may have numerous typos and missing text purchasers can usually download a free scanned copy of the original book without typos from the publisher not indexed not illustrated 1912 edition excerpt step the production of ferric chloride at this point is advantageous in that it dissolves copper oxide copper sulphide or metallic copper which remained unaffected by the roasting producing copper chloride and this ferricchloride also maintains the copper chloride in the cupric condition the gold and silver in the ore are brought into solution by converting all the copper into cupric chloride and then adding a small amount of chlorine chlorous or chloric compounds the chlorides of silver and gold being soluble in calcium chloride solutions may afterward be precipitated with the copper and subsequently separated after leaving the reaction drum the mass of gangue solution and precipitates is subjected to filtration the solid matter forms a cake which consists of the gangue in the ore except a small amount of iron and alumina which have been taken into solution and the calcium sulphate precipitate already mentioned the solution comprises a carrier in which has been dissolved the metals to be recovered a small amount of iron and alumina and any zinc which

may have been in the ore the arsenic will have been separated by filtration as it has been rendered insoluble the solution is then subjected if necessary to a further oxidizing operation in order to be sure that the metals are all combined at their highest valency the solution is then in condition for treatment for the separation of the dissolved metals the precipitation of iron and alumina may be made by cupric oxide hydrate or calcium carbonate and as this precipitate will carry some copper it is returned to the amphydizer or roasting furnace after having been removed from the solution by filtration in the amphydizer the iron and alumina in the precipitate are

this multi author new edition revises and updates the classic reference by william g davenport et al winner of among other awards the 2003 aime mineral industry educator of the year award for inspiring students in the pursuit of clarity providing fully updated coverage of the copper production process encompassing topics as diverse as environmental technology for wind and solar energy transmission treatment of waste by products and recycling of electronic scrap for potential alternative technology implementation the authors examine industrially grounded treatments of process fundamentals and the beneficiation of raw materials smelting and converting hydrometallurgical processes and refining technology for a mine to market perspective from primary and secondary raw materials extraction to shipping of rod or billet to customers the modern coverage of the work includes both smelting processes such as ausmelt and isasmelt which have become state of the art in sulfide concentrate smelting and converting drawing on extensive international industrial consultancies within working plants this work describes in depth the complete copper production process starting from both primary and secondary raw materials and ending with rod or billet being shipped to customers the work focuses particularly on currently used industrial processes used to turn raw materials into refined copper metal rather than ideas working only on paper new areas of coverage include the environmentally appropriate uses of copper cables in power transmission for wind and solar energy sources the recycling of electronic scrap as an important new feedstock to the copper industry and state of the art ausmelt and isasmelt bath smelting processes for sulfide concentrate smelting and converting
