facts an elementary acquaintance with topology algebra and analysis in cluding the notion of a manifold is sufficient as far as the understanding of this book is concerned all the necessary properties and theorems have been gathered in the preliminary chapters either with proofs or with references to standard and elementary textbooks the first chapter of the book is devoted to a study of the rings oa of holomorphic functions the notions of analytic sets and germs are introduced in the second chapter its aim is to present elementary properties of these objects also in connection with ideals of the rings oa the case of principal germs 5 and one dimensional germs puiseux theorem 6 are treated separately the main step towards understanding of the local structure of analytic sets is ruckert s descriptive lemma proved in chapter iii among its conse quences is the important hilbert nullstellensatz 4 in the fourth chapter a study of local structure normal triples 1 is followed by an exposition of the basic properties of analytic sets the

latter includes theorems on the set of singular points irreducibility and decom position into irreducible branches 2 the role played by the ring 0 a of an analytic germ is shown 4 then the remmert stein theorem on re movable singularities is proved 6 the last part of the chapter deals with analytically constructible sets 7

an impressive collection of original research papers in discrete and computational geometry contributed by many leading researchers in these fields as a tribute to jacob e goodman and richard pollack two of the founding fathers of the area on the occasion of their 2 3 x 100 birthdays the topics covered by the 41 papers provide professionals and graduate students with a comprehensive presentation of the state of the art in most aspects of discrete and computational geometry including geometric algorithms study of arrangements geometric graph theory quantitative and algorithmic real algebraic geometry with important connections to algebraic geometry convexity polyhedral combinatorics the theory of packing covering and tiling the book serves as an invaluable source of reference in this discipline

famed mathematician alexander grothendieck in his resume set forth his plan for the study of the finer structure of banach spaces he used tensor products as a foundation upon which he built the classes of operators most important to the study of banach spaces and established the importance of the local theory in the study of these operators and the spaces they act upon when lintenstrauss and pelczynski addressed his work at the rebirth of banach space theory they shed his fundamental inequality in the trappings of operator ideals by shedding the tensorial formulation the authors of this book however feel that there is much of value in grothendieck s original formulations in the resume and here endeavor to expose the resume by presenting most of grothendieck s arguments using the mathematical tools that were available to him at the time

in the framework of algebraic supergeometry the authors give a construction of the scheme theoretic supergeometric analogue of split reductive algebraic group schemes namely affine algebraic supergroups associated to simple lie superalgebras of classical type in particular all lie superalgebras of both basic and strange types are considered this provides a unified approach to most of the algebraic supergroups considered so far in the literature and an effective method to construct new ones the authors method follows the pattern of a suitable scheme theoretic revisitation of chevalley s construction of semisimple algebraic groups adapted to the reductive case as an intermediate step they prove an existence theorem for chevalley bases of simple classical lie superalgebras and a pbw like theorem for their associated kostant superalgebras
