advanced computation in design across all disciplines and to all readers who need to gain a better understanding of designing component based software development is the next step after object oriented programming that promises to reduce complexity and improve reusability. These advantages have also been identified by the industry and consequently over the past years a large number of component based techniques and processes have been adopted in many of these organizations. A visible result of this is the number of component models that have been developed and standardized. These models define how individual software components interact with each other and simplify the design process of software systems by allowing developers to choose from previously existing components. The development of component models is a first step in the right direction but there are many challenges that cannot be solved by the development of a new component model alone. Such challenges are the adaptation of components and their development and verification. Software composition is the premiere workshop to advance the research in component based software engineering and its related fields. SC 2005 was the fourth workshop in this series as in previous years. SC 2005 was organized as an event co-located with the ETAPS conference. This year's program consisted of a keynote on the revival of dynamic languages given by Prof. Oscar Nierstrasz and 13 technical paper presentations. 9 full and 4 short papers. The technical papers were carefully selected from a total of 41 submitted papers. Each paper was thoroughly peer-reviewed by at least three members of the program committee and consensus on acceptance was achieved by means of an electronic PC discussion. This LNCs volume contains the revised versions of the papers presented at SC 2005.
