accompanying cd rom contains an alphabetical list of about 14 000 references on carbonate rocks and visual comparison charts for percentage estimation p vi

the updated textbook is intended to serve as an advanced and detailed treatment of the evolution of the subject of stratigraphy from its disparate beginnings as separate studies of sedimentology lithostratigraphy chronostratigraphy etc into a modern integrated discipline in which all components are necessary there is a historical introduction which now includes information about the timeline of the evolution of the components of modern stratigraphy the elements of the various components facies analysis sequence stratigraphy mapping methods chronostratigraphic methods etc are outlined and a chapter discussing the modern synthesis is included near the end of the book which closes with a discussion of future research trends in the study of time as preserved in the stratigraphic record

this is a compilation of keynote papers from the 2002 conference of the canadian society of petroleum geologists and the 2004 annual conference of the american association of petroleum geologists and sepm these sessions entitled facies models revisited were intended to capture the state of the art with respect to facies modeling in several key depositional environments this volume is focused on clastic depositional settings including continental aeolian and fluvial estuarine shoreface deltaic shelf and deep water the approach that was encouraged with the authors was to follow a first principles rather than a model driven approach this philosophy was to provide the reader with the tools and rules to create their own models rather than providing them with canned models or templates following this approach it is believed that geoscientists will develop better and more predictive facies of depositional models the editors believe this volume will find a niche with both academic as well as industry and government geoscientists

a revised edition that provides a full update on the most current methods tools

over the past five years there have been many advances in the field of basin analysis developments such as the publication of new stratigraphic codes new research in fission track dating evolution of thought regarding the importance of tectonic versus eustatic controls of regional and global cycles and refinements of geophysically based basin subsidence models have necessitated the publication of a second edition of principles of sedimentary basin analysis like the first edition this book emphasizes the stratigraphic evidence which geologists can actually see in outcrops well records and core samples and can gather using geophysical techniques principles of sedimentary basin analysis is both an excellent text for students and a practical handbook for professional geologists

one of our aims in the book is to provide geologists with a sound basis for making their own well founded interpretations for that reason we cover not only concepts about processes and the nature of the products but also methods and approaches that may be useful in analysing both modern and ancient successions most importantly we treat the diversity of products in volcanic terrains as facies and we use the method of facies analysis and interpretation as a means of constructing facies models for different volcanic settings these models will we hope be useful as norms for comparison for workers in ancient terrains the idea for this book came into being between 1981 and 1982 when j v w came to monash university to take up a monash postdoctoral fellowship during this period a short course on facies analysis in modern and ancient successions was put together integrating j v w s extensive volcanological experience in numerous modern volcanic terrains with r a f c s extensive sedimentological and volcanological experience in older volcanic and associated sedimentary successions in the palaeozoic and precambrian of australia the enthusiastic response from the participants to the first short course taught in may 1982 and to subsequent annual re runs encouraged us to develop the short course notes into this book the idea for both the short course and the book arose because we felt that there was no single source available that comprehensively attempted to address the problems of analysing interpreting and understanding the complexity

the geological association of canada s facies models 4 is the essential volume on sedimentary succession interpretation presented in full color this updated edition of the original highly popular textbook incorporates the enormous advances in our understanding of depositional environments

conceived and written by a geologist for geologists fundamentals of well log interpretation is a considerably revised and updated translation of the french edition part 1 dealt with the acquisition of logging data and when it appeared one reviewer wrote serra has written a major reference work which is unusually well organized well illustrated and information rich if volume 2 is as thorough and exacting in detail as volume 1 it will do much toward furthering geologists knowledge of well logging aapg bulletin the fundamental objective of this second volume is to show that wireline log data constitute a remarkable source of geological information of the utmost importance for geologists but also for reservoir engineers geophysicists and petrophysicists too often by nature of their training geologists do not realize that wireline log data which are physical data hold in fact a tremendous variety of geological information covering practically all branches of geology they are reluctant to use these data because often they are not familiar with them and do not know how to interpret wireline logs
