solution of equations and systems of equations second edition deals with
the laguerre iteration interpolating polynomials method of steepest descent
and the theory of divided differences the book reviews the formula for
confluent divided differences newton s interpolation formula general
interpolation problems and the triangular schemes for computing divided
differences the text explains the method of false position regula falsi and
cites examples of computation using the regula falsi the book discusses
iterations by monotonic iterating functions and analyzes the connection of
the regula falsi with the theory of iteration the text also explains the idea of
the newton raphson method and compares it with the regula falsi the book

discover a new generation of organic nanomaterials and their applications recent developments in nanoscience and nanotechnology have given rise to a new generation of functional organic nanomaterials with controlled morphology and well defined properties which enable a broad range of useful applications this book explores some of the most important of these organic nanomaterials describing how they are synthesized and characterized moreover the book explains how researchers have incorporated organic nanomaterials into devices for real world applications featuring contributions from an international team of leading nanoscientists organic nanomaterials is divided into five parts part one introduces the fundamentals of nanomaterials and self assembled nanostructures part two examines carbon nanostructures from fullerenes to carbon nanotubes to graphene reporting on properties theoretical studies and applications part three investigates key aspects of some inorganic materials self assembled monolayers organic field effect transistors and molecular self assembly at solid surfaces part four explores topics that involve both biological aspects and nanomaterials such as biofunctionalized surfaces part five offers detailed examples of how organic nanomaterials enhance sensors and molecular photovoltaics most of the chapters end with a summary highlighting the key points references at the end of each chapter guide readers to the growing body of original research reports and reviews in the field reflecting the interdisciplinary nature of organic nanomaterials this book is recommended for researchers in chemistry physics materials science polymer science and chemical and materials engineering all readers will learn the principles of synthesizing and characterizing new organic nanomaterials in order to support a broad range of exciting new applications

this book tells the story of two of the most important figures in the history of

chemistry carl wilhelm scheele 1742 1786 was the first to prepare oxygen and realise that air is a mixture of nitrogen and oxygen he also discovered many important organic and inorganic substances his fellow chemist and good friend torbern bergman 1735 1784 was one of the pioneers in analytical and physical chemistry in this carefully researched biography the author anders lennartson explains the chemistry of scheele and bergman while putting their discoveries in the context of other 18th century chemistry much of the information contained in this work is available in english for the first time

the eighteenth century was the formative period in which chemistry established itself as an autonomous discipline with its own concepts and modes of explanation independent of mathematical physics yet much previous writing in this area has concentrated on theories derived from more traditionally respectable branches of knowledge such as physics this book traces the transition from the chemists point of view through the evolution of notions of chemical affinity and attraction the physicists attempts to explain chemical combination and chemists development of their own models it describes the growth of affinity tables which chemists hoped would lead to the induction of predictive laws and which represented their unofficial list of elements which eventually through the work of lavoisier replaced the traditional aristotelian list the book also discusses chemists efforts to account for double decomposition to measure affinity or attraction quantitatively to classify types of affinity and to state laws of chemistry

this important volume features essays dealing with a wide range of theoretical measurement and policy issues in environmental and resource economics anthony fisher is an internationally acclaimed environmental economist whose work combines relevance with intellectual rigour the integration of environmental considerations into decisions about extractive resource has been a central theme of professor fisher s work the essays in this collection range from exercises in the pure theory of resource depletion to applications of theoretical and empirical techniques on the management

of energy and water resources particular attention is given to uncertainty about environmental values and the irreversibility of certain kinds of resource depletion featuring work on a wide range of topics and adopting a breadth of approaches environmental and resource economics will be welcomed by researchers practitioners and policymakers
