our objectives may be briefly stated they are two first we have sought to provide a compact and digestible exposition of some sub branches of mathematics which are of interest to economists but which are underplayed in mathematical texts and dispersed in the journal literature second we have sought to demonstrate the usefulness of the mathematics by providing a systematic account of modern neoclassical economics that is of those parts of economics from which jointness in production has been excluded the book is introductory not in the sense that it can be read by any high school graduate but in the sense that it provides some of the mathematics needed to appreciate modern general equilibrium economic theory it is aimed primarily at first year graduate students and final year honors students in economics who have studied mathematics at the university level for two years and

who in particular have mastered a full year course in analysis and calculus the book is the outcome of a long correspondence punctuated by periodic visits by kimura to the university of new south wales without those visits we would never have finished they were made possible by generous grants from the leverhulme foundation nagoya city university and the university of new south wales equally indispensable were the expert advice and generous encouragement of our friends martin beckmann takashi negishi ryuzo sato and yasuo uekawa

providing an introduction to mathematical analysis as it applies to economic theory and econometrics this book bridges the gap that has separated the teaching of basic mathematics for economics and the increasingly advanced mathematics demanded in economics research today dean corbae maxwell b stinchcombe and juraj zeman equip students with the knowledge of real and functional analysis and measure theory they need to read and do research in economic and econometric theory unlike other mathematics textbooks for economics an introduction to mathematical analysis for economic theory and econometrics takes a unified approach to understanding basic and advanced spaces through the application of the metric completion theorem this is the concept by which for example the real numbers complete the rational numbers and measure spaces complete fields of measurable sets another of the book s unique features is its concentration on the mathematical foundations of econometrics to illustrate difficult concepts the authors use simple examples drawn from economic theory and econometrics accessible and rigorous the book is self contained providing proofs of theorems and assuming only an undergraduate background in calculus and linear algebra begins with mathematical analysis and economic examples accessible to advanced undergraduates in order to build intuition for more complex analysis used by graduate students and researchers takes a unified approach to understanding basic and advanced spaces of numbers through application of the metric completion theorem focuses on examples from econometrics to explain topics in measure theory

under the assumption of a basic knowledge of algebra and analysis micro and macro economics this self contained and self sufficient textbook is targeted towards upper undergraduate audiences in economics and related fields such as business management and the applied social sciences the basic economics core ideas and theories are exposed and developed together with the corresponding mathematical formulations from the basics progress is rapidly made to sophisticated nonlinear economic modelling and real world problem solving extensive exercises are included and the textbook is particularly well suited for computer assisted learning

this two volume work functions both as a textbook for graduates and as a reference for economic scholars assuming only the minimal mathematics background required of every second year graduate the two volumes provide a self contained and careful development of mathematics through locally convex topological vector spaces and fixed point separation and selection theorems in such spaces volume one covers basic set theory sequences and series continuous and semi continuous functions an introduction to general linear spaces basic convexity theory and applications to economics

this sequel to the author s early development in mathematical economics covers developments in this field after the appearance of cournot s recherches in 1838 and until the publication of jevons theory in 1871

complete rigorous expositions of economic models analyzed primarily according to their mathematical properties optimizing theory static and dynamic models
