the text is aimed at final year undergraduate students or those at the graduate level doing econometrics for the first time it is an introductory course in the theory and practice of classical and modern econometric methods a proper study of the material will allow the reader to understand the scope and limitations of classical and modern econometric techniques read write and properly interpret articles and reports of an applied econometric nature build upon the elements of econometric theory and practice introduced in the book although some basic knowledge of matrix algebra and elementary statistical theory will be assumed much of it is covered in the body of the text all the main theoretical concepts are illustrated with the use of econometric software mainly eviews

this is a textbook designed for undergraduate and graduate students and is the result of the author s more than twenty years of involvement with econometrics as both teacher and researcher it

contains theory problems and answers many of which have already been tested extensively in classrooms and tutorials and then refined for the book it includes the following topics single equation regressions dummy and limited dependent variable models simultaneous equations models dynamic regression models unit roots cointegration and error correction models aggregation over time issues forecasting and panel data models the book does not attempt to duplicate the many standard econometrics books rather it supplements them by focusing exclusively on theoretical and empirical exercises in a systematic way although much of the material has a caribbean flavour its rigorous and clear presentation will appeal to students and teachers worldwide

econometric theory as presented in textbooks and the econometric literature generally is a somewhat disparate collection of findings its essential nature is to be a set of demonstrated results that increase over time each logically based on a specific set of axioms or assumptions yet at every moment rather than a finished work these inevitably form an incomplete body of knowledge the practice of econometric theory consists of selecting from applying and evaluating this literature so as to test its applicability and range the creation development and use of computer software has led applied economic research into a new age this book describes the history of econometric computation from 1950 to the present day based upon an interactive survey involving the collaboration of the many econometricians who have designed and developed this software it identifies each of the econometric software packages that are made available to and used by economists and econometricians worldwide

illustrates bayesian theory and application through a series of exercises in question and answer format

tony lawson has become a major figure of intellectual controversy on the back of juxtaposing two relatively simple and seemingly innocuous ideas he has argued firstly that success in science depends on finding and using methods including modes of reasoning appropriate to the nature of the phenomena being studied and also that there are important differences between the nature of the objects of study of natural sciences and those of social science this original book brings together some of the world's leading critics of economics orthodoxy to debate lawson's contribution to the economics literature the debate centres on ontology which means enquiry into the nature of what exists and in this collection scholars such as bruce caldwell john b davis and geoffrey m hodgson present their thoughtful criticisms of lawson's work lawson himself presents his reactions to these criticisms with full chapter replies to each of the scholars included this book is particularly useful for students and researchers concerned primarily with methodology and future development of economics it is also relevant to the concerns of philosophers of science and to all social scientists interested in methodological issues

this reference introduces the basic econometric methods and the underlying assumptions behind them it also includes a simple and concise treatment of more advanced topics in time series spatial correlation limited dependent variables and panel data models as well as specification testing gauss newton regressions and regression diagnostics the strengths of this book lie in presenting difficult material in a simple yet rigorous manner in addition the book features a set of empirical illustrations that demonstrate some of the basic results the empirical exercises are solved using several

econometric software packages

provides hands on experience of econometrics with estimation and inference each chapter begins with a discussion of economic theory underlying the application

this work on econometrics offers an analysis of econometric practice encompassing recent modelling methodology and pc give it is intended for advanced undergraduates and graduate students

matrix algebra is the first volume of the econometric exercises series it contains exercises relating to course material in matrix algebra that students are expected to know while enrolled in an advanced undergraduate or a postgraduate course in econometrics or statistics the book contains a comprehensive collection of exercises all with full answers but the book is not just a collection of exercises in fact it is a textbook though one that is organized in a completely different manner than the usual textbook the volume can be used either as a self contained course in matrix algebra or as a supplementary text

econometric issues have provoked a lively and sometimes adversarial debate in the economics profession the excitement and intellectual vitality of that debate is captured here for the reader in a lucid overview of econometric approaches describing their advantages and limitations this ambitious book focuses on the underlying methodological issues rather than concentrating upon econometric techniques the limits of econometric investigations are identified through a critical appraisal of three different approaches associated with the work of professors hendry leamer and sims after explaining why the early optimism in econometrics was misplaced it argues that rejection is not an appropriate response it offers a rich spectrum of approaches to a problem of central importance in the development of modern economics the book will appeal not only to all econometricians whatever their persuasion but also to all those with an interest in the methodology of economics

this volume honors george judge and his many varied and outstanding contributions to econometrics statistics mathematical programming and spatial equilibrium modeling the papers are grouped into four parts each part representing an area in which professor judge has made a significant contribution the authors have all benefited in some way directly or indirectly through an association with george judge and his work the three papers in part i are concerned with various aspects of pre test and stein rule estimation part ii contains applications of bayesian methodology new developments in bayesian methodology and an overview of bayesian econometrics the papers in part iii comprise new developments in time series analysis improved estimation and markov chain analysis the final part on spatial equilibrium modeling contains papers that had their origins from professor judge s pioneering work in the 60 s

this text on econometric method builds up from the classical regression model to cover large sample theory disturbance problems generalized least squares dynamic models distributed lags simultaneous equation models time series models and limited dependent variable models
