this volume emphasizes students inferred mathematical experiences as the starting point in the theory building process the book addresses conceptual constructions including multiplicative notions fractions algebra and the fundamental theorem of calculus and theoretical constructs such as the crucial role of language and symbols and the importance of dynamic imagery

this textbook is an elementary introduction to the key topics in mathematical finance and financial economics two realms of ideas that substantially overlap but are often treated separately from each other our goal is to present the highlights in the field with the emphasis on the financial and economic content of the models concepts and results the book provides a novel unified treatment of the subject by deriving each topic from common fundamental principles and showing the interrelations between the key themes although the presentation is fully rigorous with some rare and clearly marked exceptions the book restricts itself to the use of only elementary mathematical concepts and techniques no advanced mathematics such as stochastic calculus is used

in my long professional life as a mathematician i have had to deliver various survey lectures they were of different character according to the occasion a selected number are reproduced in this volume they were with few exceptions printed in books or in periodicals and are reproduced here without any modification i started as a student at the eth zurich in 1935 and have spent my working ufe there with the exception of the period 1942 1948 lecturer then associate professor at the university of lausanne and 1947 and 1951 52 institute for advanced study princeton in 1948 i was appointed as a professor at the eth i retired in 1984 and have since then been professor emeritus the surveys in this volume are lectures given at congresses and workshops at international congresses of mathematicians plenary or section lectures and at special occasions like birthdays or commemorations they all reflect the special interests of the respective times although they are in fields of topology algebra and differential geometry they reveal the big changes mathematics has undergone over the years from 1943 to 2004 new thinking has been developed it has created new problems or simply has let old problems appear in a new light

overall this is an appealing work for students and professionals and is certain to remain as one of the key works in natural resource analysis mathematical reviews biological renewable resources essential to the survival of mankind are increasingly overexploited by individuals and corporations that often sacrifice long term economic health and sustainability for short term gains mathematical bioeconomics the mathematics of conservation third edition analyzes the economic forces underlying these misuses of renewable resources and discusses more effective methods of resource management promoting a complete understanding of general principles the book allows readers to discover how rigorous mathematical models that incorporate both economic and biological factors should replace intuitive arguments for conservation and sustainability

this third edition continues to combine methodologies from the fields of economics biology and mathematics to explain how analytic models are essential for developing a complete understanding of complex resource systems the book has been updated to address the need for incorporating individual economic incentives the value of diversity and the overriding importance of uncertainty in mathematical models coverage of game theory overcapacity uncertainty and risk analysis has been added as well a expanded treatment of topics such as models of individual harvest behavior and economic incentives response of individual harvester to various types of harvesting regulations reasons underlying excess harvesting capacity externalities in resource harvesting industries decision analysis in biological resource management fundamental concepts of population dynamics and economics are utilized throughout the book while mathematical techniques are incorporated in an accessible manner relevant data from current research sheds light on the presented material and exercises provide readers with an opportunity to test comprehension of discussed mathematical methods and techniques continuing to provide a complete and modernized presentation of the fundamental principles of the topic mathematical bioeconomics third edition is an excellent book for courses on applied mathematics resource management and environmental studies at the upper undergraduate and graduate levels it also serves as an insightful reference for resource managers ecologists biologists and other professionals who work to improve the management of renewable resources and develop sustainable practices in the environmental sciences

this volume contains twenty contributions in the area of mathematical physics where fritz gesztesy made profound contributions there are three survey papers in spectral theory differential equations and mathematical physics which highlight in particu

joseph w dauben a leading authority on the history of mathematics in europe china and north america has played a pivotal role in promoting international scholarship over the last forty years this festschrift volume showcasing recent historical research by leading experts on three continents offers a global perspective on important themes in this field
