the department of defense looks increasingly towards an interoperable and integrated system of systems to provide required military capability non essential software complexity of a system of systems can have a greater negative impact in system behavior than a single system our current systems of systems tend to require a great deal of software maintenance and to be intolerant of even the most minor of changes with respect to negative perturbations in system behavior in this thesis we explore the benefits of developing a conceptual framework as the basis for the system of systems development we examine the application of accepted software engineering practices for single system developments to the more complex problem of system of systems development using the ballistic missile defense system as a case study we present an abstract framework from which we can reason about the system of systems we develop a conceptual software architecture that represents a logical organization of proposed software modules we map the functionality of the system to conceptual software components with coordination and data exchanges handled by conceptual connectors finally we assess our work to determine the feasibility of applying the conceptual framework techniques described in this thesis to system of systems acquisitions with the objective of reducing accidental complexity and controlling essential complexity
