how slaves created the organized black church while still under the oppression of bondage

do you ever wonder why things never seem to change in washington dc no matter which political party is in power is it because both political parties are working together to achieve their goals instead of working to restore america to the great country she was not so long ago in this book the author examines some topics from a proud conservative side if you love america and want to read a book that points out some of the hypocrisies we are told on a regular basis this book is for you it is a patriotic reminder of who we are as a people the liberal progressives in both political parties along with the liberal media are trying to change our core beliefs on a daily basis our politicians are not really worried about the financial cliff they have brought us to today in this book i try to point out little known reported facts and also offer my conservative opinions on several different subjects i try to get people to realize how close we are to being ruled instead of governed it is incumbent on we the people to do our constitutional duty and stay aware of what those fools on the hill are doing to us so to speak i point out things about both republican and democrats so i am an equal opportunity offender neither political party cares about us and until more fellow citizens wake up we will keep having the kind of government indifference and apathy elects

four deceptively simple questions have guided our long term research into the aboriginal lifeways of st catherines island 1 how and why did the human landscape settlement patterns and land use change through time 2 to what extent were subsistence and settlement patterns shaped by human population increase intensification and competition for resources 3 what factors can account for the emergence of social inequality in georgia s sea islands 4 can systematically collected archaeological evidence resolve the conflicting ethno historic interpretations of the aboriginal georgia coast the so called gule problem over a span of four decades the american museum of natural history has addressed these four fundamental questions using a broad array of field and analytical techniques we conducted a 20 percent probabilistic transect survey of st catherines island walking and probing for buried sites across a series of 31 east west transects each 100 m wide during this initial survey we located 122 archaeological sites which we tested with more than 400 one meter by one meter units because the transect sampling was heavily biased toward sites with marine shell we also conducted a systematic shovel testing program we also augmented these systematic surveys with a direct shoreline reconnaissance mostly following the late holocene surfaces recording roughly 84 additional shoreline sites on st catherines island by plotting the distribution of these known age sites across the holocene beach ridges we have developed a detailed sequence documenting the progradation and erosion of beach ridge complexes adjacent to tidal estuaries and oceanward shorelines on the island to evaluate the results of the 1000 test explorations and excavations on st catherines island we have processed 251 radiocarbon determinations including two dozen dates on modern mollusks known age specimens collected prior to atomic bomb contamination to compute a reservoir correction factor specific to the estuaries around st catherines island of $\Delta R = 134 \pm 26$ the results have been compiled into a dataset of 239 radiocarbon determinations for samples from st catherines island one hundred and ten of these dates from 31 distinct mortuary and midden sites could be directly associated with datable ceramic assemblages which were classified according to chester depratter s 1979 1991 northern georgia coast chronology by comparing the results of typological classification with the radiocarbon evidence currently available from st catherines island we propose a slightly modified ceramic chronology for st catherines island we analyzed the seasonal growth increments in modern hard clams *mercenaria mercenaria* for a 9 year interval beginning in 1975 *mercenaria* suitable for seasonal analysis were recovered from nearly 85 percent 110 of 130 of the sites identified and sampled in the island wide survey we analyzed about 2000 individual hard clam shells recovered from these shell middens and of these 1771 individual specimens or fragments provided usable growth increment estimates enabling us to address seasonal patterns during the 5000 years of human history this study is reinforced by an oxygen isotope study of modern and ancient clams from st catherines island this transect survey produced an extensive and diverse set of vertebrate faunal remains collected systematically from archaeological sites tested across the entire island elizabeth reitz and her colleagues analyzed this vertebrate faunal assemblage which contains at least 586 individuals represented by 14 970 vertebrate specimens weighing 21 615 g these materials provide a solid basis for refining hypotheses not only for st catherines island but for most coastal locations with the exception of the first and last occupations the st simons and altamaha periods the samples suggest a stable pattern of resource use through time with little variation through time or across space although the small sample sizes for each time period and circumscribed geographical setting might constrain this interpretation she also notes the presence of numerous seasonal indicators in the vertebrate zoo archaeological samples recovered from archaeological sites on st catherines island including unshed deer antlers juvenile deer dentition and shark and sea catfish remains but we also recognized the importance of examining diverse sources of seasonal information in our attempt to flesh out overall patterns of site utilization we also include analysis of the vertebrate zooarchaeological assemblages from meeting house field and fallen tree two additional sites intensively investigated by the american museum of natural history and the university of georgia the intensive program of mortuary archaeology has recovered the remains of more than 725 individuals from 18 archaeological sites on st catherines island more than 90 percent of these remains were analyzed by clark spencer larsen and his colleagues using a variety of microscopic biomechanical and stable isotopic techniques in this monograph we address the archaeology of st catherines island using the broad based theoretical approach known as optimal foraging theory which is grounded in the more general paradigm of human behavioral ecology that studies human behavior by applying the principles of natural selection within an ecological context the broad rubric of optimal foraging theory encompasses a broad range of specific models each of which employs a unique set of simplifying assumptions and constraints and each can be used to derive testable hypotheses about foraging behavior under certain environmental circumstances each model is a formal mathematical construct and they share the key assumption that during economic pursuits the forager will operate to maximize the overall rate of energetic return specifically we have employed three basic models to address the archaeology of st catherines island the diet breadth or prey choice model addresses the issue of which foods should an efficient forager harvest from all those available on st catherines island diet breadth models predict that foragers will optimize the time spent capturing prey and employ the simplifying assumptions that all resources are randomly distributed without patches and that capture handling and search times represent the sum total of all time spent foraging we also apply the patch choice model which combined with the central limit theorem predicts that foraging effort will correlate directly with efficiency rank order meaning that foragers should spend more time working the higher ranked patches and less time in patches with lower energetic potential finally we likewise employ the central place foraging model to investigate the time energy spent processing resources at temporary camps before transport to a residential base we find central place foraging theory to be useful for addressing the role and location of the residential base as a locus for provisioning offspring and mates or potential mates this monograph also reports the results of optimal foraging experiments conducted over a 2 year period on st catherines island specifically addressing procurement and return rates for key marine and terrestrial resources that would have been available to aboriginal foragers on st catherines island
